Abstract

Prediction of the Expiry Date for various products and commodities acquired great importance for a long time, but the Expiration Date for textile products has for long periods is not discretionary research dealt with sufficient attention despite the economic importance of first-class, especially for the major institutions that deal with these products in large quantities Tethera real impact on their budgets and accounts patrol

The research aims to find An Analytical Method for Prediction the Expiry Date for some bed sheets produced for export, which is regarded as one of the most important measures the quality performance of of bed sheets one hand, and theoretical evidence in the accounts of feasibility studies for companies imported. Because the Expiration Date of bed sheets depends mainly on the deterioration of the mechanical properties, particularly the so-called mechanical fatigue, the stresses resulting from the operations of care have the greatest impact on determining the Expiration Date of bed sheets.

Therefore, this research study was concerned with the impact of the number of sessions of laundry and drying on the quality of bed linen fabrics of cotton and blended to identify the best Construction textiles resistance to the impact of repeated care methods and identification of a ‘cycle’ of consumption of bed sheets.
