*Answer the following questions*

**Exp. (1)**

- a) Use the downward experimental data to calculate the ratio e/m by using the magnetron method.
- b) What is the difference between the coil you use in this experiment and that in Thompson's?
- c) Does the magnetic field do a work on the electron beam?  
Explain clearly.

Where: N= 250 turns,  $r_a = 0.6$  cm, L= 6 cm, D=6.5 cm

Note: use the following values for  $V_a = 10, 15, 20, 25$  (V)

## Exp. (2)

- a) Using the given data to determine the refractive index of the prism for different wavelengths.
- b) Verify Cauchy's formula and determine A, B
- c) Is the refractive index of the material depends on the wavelength? Explain

( $\lambda_{\text{yellow}}=579 \text{ nm}$ ,  $\lambda_{\text{green}}=546.1 \text{ nm}$ ,  $\lambda_{\text{blue}}=435.8 \text{ nm}$ ,  $\lambda_{\text{violet}}=407.8 \text{ nm}$ ).

### Exp. (3)

- a) Using the given data to determine the first excitation state potential of the argon gas inside the Frank-Hertz experiment?

Note: use the following values for  $V_f=3.5V$ ,  $V_{GA}=12$ .

- b) What's the effect of varying  $V_f$  to be (3, 3.5, 4 and 4.5 V) on the I-V curve? Does this effect on the argons first excitation energy?
- c) What happen if the argon gas exchanged with Hg atoms ?

### Exp. (4)

- a) Using the given data determine radius of oil droplet in million oil drop experiment ?
- b) Calculate the total charge and on droplets for applied voltage 0,50 100, 150 and 200 V and explain what Robert million deduce from these results w.r.t the charge of electron ?
- c) What happen if the polarity of the two plates are reversed during the falling of oil drops?

$$V_1=0.0032 \text{ m/s} \quad \text{at } V=0 \text{ v}$$

$$\rho_{\text{oil}}=981 \text{ Kg/m}^3, \rho_{\text{air}}=1.18 \text{ Kg/m}^3,$$
