

Electrocardiogram

DESIGNED BY: NANCY MOHAMMED

UNDER THE SUPERVISION OF:
PROFESSOR DR. AYMAN HAIDER

Content :

- i. Anatomy of the heart.
- ii. Blood flow through the heart.
- iii. ECG introduction.
- iv. Conductive system of the heart.
- v. Basics of ECG.
- vi. ECG problems

ANATOMY OF THE HEART:

Blood flow through the heart :

ECG introduction :

What is an ECG ?

'ECG' stands for electrocardiogram, or electrocardiograph

What is the function of ECG?

The ECG records where electrical impulses start and how they flow through the heart.

When do you need an ECG?

chest pain,
palpitations, breathlessness or dizziness, or if the patient has had an episode of syncope (blackout) or an unexplained fall. In addition, a patient with a stroke or a transient ischaemic attack (TIA) must have an ECG as these may be due to an irregular heart rhythm.

How to record an ECG?

Electrodes are placed on the chest and limbs of the patient to record different views of the heart's electrical activity. Each view of the heart is described as a 'lead'. The word 'lead' does **not** refer to the electrodes.

Lead positions for a 12-lead ECG with 12 views of the heart :

For a full picture of the heart's electrical activity, a 12-lead view is conventional.

One electrode is attached to each limb. These four electrodes provide six 'limb leads' or six different views of the heart in a vertical plane. These are called leads I, II, III, VL, VF and VR. VL, VF and VR used to be called AVL, AVF and AVR, respectively, but the A is essentially meaningless and is redundant.

Six electrodes are attached to the chest, recording leads V1 to V6.

Accurate placement of these electrodes is essential for comparing later

ECGs

Conductive system of the heart :

Bacics of ECG :

P wave:

Atrial depolarization (contraction).

QRS :

ventricular depolarization
(contraction).

PR interval :

AV node point of physiological
delay,
Decreases atrium peats from 300 to
120 to prevent ventricular fibrillation.

ST segment:

Iso electric period no have any
electric activity.

T wave :

Ventricular
repolarization(relaxation)

U wave :

Hypokalemia(Ca level decreases)

Any electrical current have:
Force & direction ECG record them.

ECG 12 leads :

V1 – V2 ► Right ventricle البطين الأيمن

V3 – V4 ► Interventricular septum الحاجز الموجود بين البطينين

V5 – V6 ► Left ventricle البطين الأيسر

lead I ►

lead II ►

lead III ►

ECG reading :

- 1) Rhythm
- 2) Heart rate
- 3) Voltage
- 4) Position of the heart
- 5) Axis
- 6) P wave
- 7) PR interval
- 8) QRS complex
- 9) ST segment
- 10) T wave
- 11) QT interval
- 12) U wave

Rhythm:

Regular rhythm:

Distance between each “R” wave is similar.

Irregular rhythm:

Irregular rhythm classified in to :

- _Irregular irregularity
- _Irregular regularity

Irregular irregularity : No p wave cause (Atrial fibrillation)

Irregular rhythm:

_ Irregular regularity

Irregular regularity:

1_ Bigeminy (1 normal wave + pvc)

Atrial Bigeminy

Irregular regularity:

2_ Trigeminy (2 normal wave +pvc)

Ventricular Trigeminy

2- Rate :

Normal rate of the heart 60 -100 per/ minute Rate of regular rhythm:= $300/R_R$ square.

Regular rhythm :

Rate : $300/4 = 75$ per/minute

Rate of Irregular rhythm:

Rate of irregular rhythm:=how many QRS in 10 seconds ×6

14 R waves in 10 secs

$$14 \times 6 = 84 \text{ BPM}$$

"Axis deviations of ECG"

Normal axis ECG

Notice lead 1&2 Has the same direction

"Axis deviations of ECG"

Left axis deviations (LAD)

lead 1 & 2 are opposite direction.

"Axis deviations of ECG"

Right axis deviations (RAD)

" Causes Of Axis deviations "

Left axis deviation ECG causes:

Inferior myocardial infarction

Hyperkalemia

Ventricular ectopy

Artificial cardiac pacing

causes of the right axis deviation:

right ventricular hypertrophy,
reduced muscle mass of left ventricle,
altered conduction pathways and change
in the position of the heart in the chest.

ECG AXIS DEVIATION

“p” wave :

Result of contraction (depolarization) of atrium.

Normal duration = 3 small square

Normal amplitude = 2.5 small square

Normal p wave

“p” wave :

P- pulmonal :

Indicated to right arterial enlargement.

P- mitral :

Indicated to left atrial enlargement.

P-R interval

" P-R interval "

Indicated for electricity direction from A.V
node to
A.V bundle.

Normal duration:
3-5 small square

NORMAL ECG

" Types of heart block "

First degree heart block:
(large P-R interval) a condition where the heart's wiring is slow to send electrical signals.

Second degree heart block:

Mobitz type 1

Mobitz type 2

Mobitz Type I Second-Degree Atrioventricular Block

Mobitz type 1: Gradual prolongation then dropped p wave followed by QRS complex.

Mobitz type 2 :

Mobitz type 2

P_R interval not prolonged but have dropped peak after p wave.

Third degree heart block :

Third degree heart block :

Multiple p wave

Causes of heart block:

Older age .Heart attack or coronary artery disease.

Cardiomyopathy.

Sarcoidosis.

Lyme disease.

High potassium levels.

Severe hyperthyroidism.

Certain hereditary neuromuscular diseases.

Symptom of the heart block:

fainting, tiredness and shortness of breath ,chest pain.

" T- wave "

" T- wave "Indicate for :
Hyperkalemia
Hypokalemia

Hypokalaemia

T wave inversion
ST depression
Prominent U wave

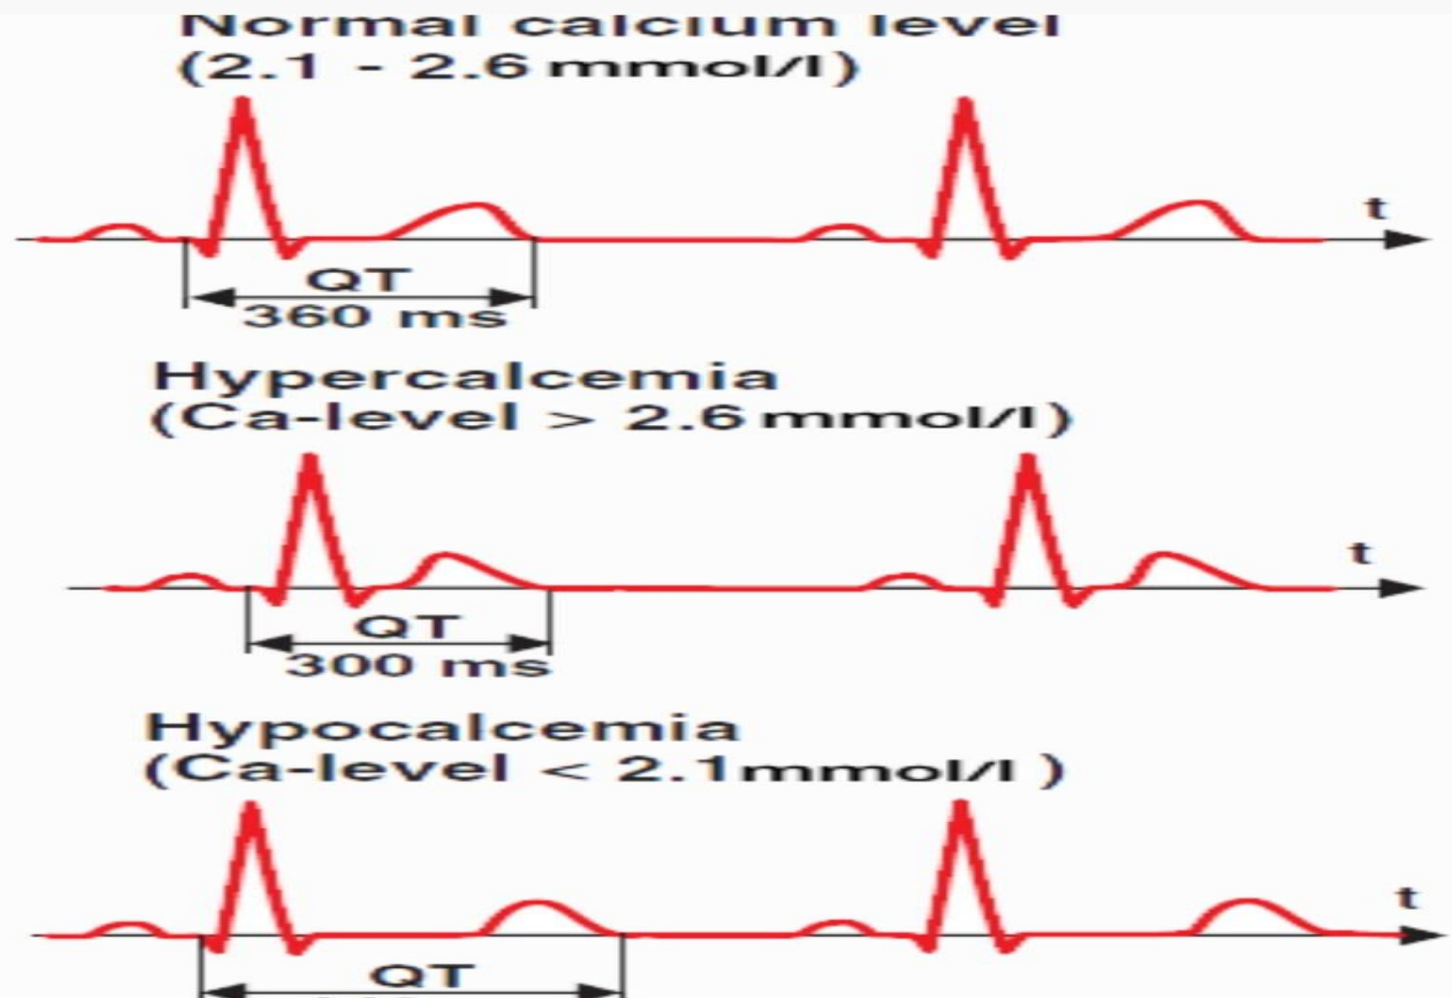

Hyperkalaemia

Peaked T waves
P wave flattening
PR prolongation
Wide QRS complex

" T- wave "

" T- wave "Indicate for :
Hypocalcemia
Hyperglycemia

Main Leads:

•12-lead ECG includes:

- Limb leads: I, II, III, aVR, aVL, aVF.
- Chest leads: V1-V6.

General Overview:

•Heart rate:

Determined by measuring the R-R intervals.
Appears regular.

•PR interval:

Normal (0.12-0.20 seconds).

Additional Notes:

•Speed:

25 mm/s.

•P wave:

Normal, indicating proper atrial activation.

•Heart rhythm:

Likely sinus rhythm, as there is a P wave before every QRS complex.

QRS complex:

Narrow (less than 0.12 seconds), indicating normal ventricular conduction.

•T wave:

Appears normal in most leads, indicating proper ventricular repolarization.
